Education

- **Bachelor of Science, Computer Science,** University of Irvine **2023 – 2027**

Work Experience

Software Engineer **Multiplayer Game Server** **June 2016 – Jan 2023**
Full-Stack & Platform Development Remote

- Designed, built, and maintained a full-stack web platform that processed real-money purchases and executed real-time commands on live game servers, bridging web transactions with backend systems.
- Integrated and customized existing server plugins to extend functionality, including cross-platform compatibility between console and PC clients.
- Engineered and maintained custom gameplay systems (e.g., King of the Hill) supporting multi-client architectures and synchronized state across platforms, which correlated with an initial doubling of active players and continued organic growth driven by player engagement.
- Unified gameplay logic across heterogeneous client environments using scripting tools to ensure a consistent, accessible user experience.
- Maintained long-running production systems, performing debugging, feature updates, and performance tuning over multiple years.

Business Development & Marketing Lead **Epic Pulls Anime Cafe LLC** **Nov 2022 - Present**
[San Jose, California]

- Develop strategic relationships with high-value customers and partners, supporting six-figure sales opportunities and improved commercial terms.
- Coordinate appearances at major trading card shows and lead revenue-growth initiatives including release events, livestreams, and promotions to expand reach and drive sales.

Projects

Text-to-SQL Research Pipeline **Jan 2026 - July 2026**

- Built an end-to-end Text-to-SQL evaluation pipeline spanning schema serialization, prompt construction, LLM inference, postprocessing, and SQLite execution.
- Benchmarked Gemma-3-4B-IT and Mistral-7B-Instruct, evaluating Exact Match, Execution Accuracy, runtime latency, and clause-level errors across the Spider benchmark.
- Analyzed performance across schema size, join complexity, and query difficulty using per-query inference and execution traces.
- Conducted ablation studies on prompt formatting, schema representation, and foreign-key context to quantify their impact on model accuracy and reliability.
- Investigated structured-generation failures and model behavior, identifying accuracy/performance tradeoffs and presenting findings as part of a research project.

Obstacle-Avoiding Robot **Oct 2020 - March 2021**

- Designed and built an autonomous robotic system using Raspberry Pi for real-time obstacle detection and navigation.
- Integrated distance sensors to monitor surroundings and trigger control decisions.
- Implemented movement logic based on sensor input to enable autonomous navigation.
- Tested and refined thresholds and control behavior to improve reliability and collision avoidance.

Technical Skills

- **Languages**: Java, JavaScript, C, C++, SQL,
- **Web**: HTML, CSS, React
- **Databases**: MySQL, SQLite
- **APIs/Backend**: REST APIs,
- **Data/ML**: Pandas, Hugging Face
- **Developer Tools**: Git, GitHub
